

The Inspection Results of Domestic Airport Facilities that could affect the Safe Aircraft Operation

Inside the airports, the basic facilities (runways, taxiways, aprons and landing strips) and the buried structures underneath could affect the safe aircraft operation, if damaged by aging and so forth, and thus the relative inspections have been conducted by the end of Sept., 2013. Please see the attachment for the inspection results.

In addition to that, we have checked whether the periodic inspections of aircraft fueling facilities are being conducted according to the Fire Service Act. For details, please see the attachment.

Meanwhile, as for the eight (8) airport terminals which inspections have not been completed by the end of June, no failure was found by recent inspections. Also, please see the attachment for details.
